BIPHENYLMETHANE DERIVATIVE AND MEDICINE CONTAINING THE SAME.**EP 0 656 355 A1**

(57) A biphenylmethane derivative represented by general formula (I), a salt thereof, and a remedy for circulatory system diseases containing the same, wherein A represents the group (II) or (III) wherein R¹ represents hydrogen, lower alkyl, lower cycloalkyl, optionally substituted phenyl, optionally substituted aralkyl, optionally substituted acyl, or amino acid residue; X represents oxygen or sulfur; Y represents nitrogen or =CR²-; Z represents oxygen, nitrogen or =CR³- (excluding the case where both of Y and Z represent nitrogen simultaneously); R² and R³ represent each independently hydrogen, halogen, optionally substituted lower alkyl, optionally protected carboxyl, lower cycloalkyl, lower alkenyl, lower alkoxy, lower alkylthio or aryl, or alternatively R², R³ and the adjacent carbon atoms may be combined together to form an optionally substituted benzene ring; and B represents cyano, optionally protected carboxyl or optionally protected tetrazol-5-yl. This compound has such potent angiotensin II antagonism and hypotensive effect that it is useful for treating circulatory system diseases such as hypertension, cardiac diseases and cerebral apoplexy.

Technical Field

The present invention relates to novel biphenylmethane derivatives and salts thereof, said derivatives and salts having a potent angiotensin II antagonist activity and also having a powerful antihypertensive activity.

Background Art

Angiotensin II is an active center of the renin-angiotensin system, and has powerful vasopressor action and stimulating action for the synthesis and secretion of aldosterone in the adrenal cortex. It is also known to be a substance causing hypertension. Its action is considered to be caused through a specific receptor on various target organs such as adrenal cortex, kidneys, arterioles and the peripheries of sympathetic nerves.

Known conventional examples of substances which shows an antihypertensive effect by pharmacological inhibition of the renin-angiotensin system include angiotensin-converting enzyme inhibitors such as captopril and enalapril, angiotensin II antagonists and renin inhibitors. As angiotensin II antagonist out of these, saralasin ([Sar¹, Ala⁸] AGII), an angiotensin II type peptide, and nonpeptide derivatives such as imidazole derivatives (Japanese Patent Laid-Open Nos. 7103/1981 and 71074/1981, and Japanese Language Laid-Open Publication (PCT) No. 501020/1991) and pyrazole derivatives (Japanese Patent Laid-open No. 218371/1991) are already known.

The peptide derivatives, however, have difficulty in clinical applications because of their short *in vivo* half-life, lack of effectiveness upon oral administration and significant agonistic activities. Among the nonpeptide derivatives, none has been used clinically yet as drugs either.

With a view toward providing a clinically excellent drug under such circumstances, the present inventors have carried out an extensive investigation. As a result, it has been found that novel biphenylmethane derivatives represented by the following formula (I) have an excellent angiotensin II antagonist activity and are useful as therapeutics for circulatory diseases such as hypertension, heart diseases and cerebral apoplexy, leading to the completion of the invention.

Disclosure of the Invention

The present invention relates to a biphenylmethane derivative represented by the following formula (I):

40 wherein A represents a group

in which R¹ represents a hydrogen atom, a lower alkyl group, a lower-cycloalkyl group, a substituted or unsubstituted phenyl group, a substituted or unsubstituted aralkyl group, a substituted or unsubstituted acyl group or an amino acid residue; X represents an oxygen atom, a sulfur atom or a group =CH-, Y represents a nitrogen atom or a group =CR²-, Z represents an oxygen atom, a nitrogen atom or a group =CR³-, said Y and Z not being hetero atoms at the same time, R² and R³ each independently represents a hydrogen atom, a halogen atom, a substituted or unsubstituted lower alkyl group, a protected or unprotected carboxyl group, a lower-cycloalkyl group, a lower alkenyl group, a lower alkoxy group, a lower alkylthio group or an aryl group or R² and R³ may form a substituted or unsubstituted benzene ring together with the adjacent carbon atoms; B represents a cyano group, a protected or unprotected carboxyl group or a protected or unprotected tetrazol-5-yl group and \equiv shows a double bond or a single bond; or a salt

thereof.

The present invention also relates to a therapeutic for circulatory diseases, which comprises the biphenylmethane derivative or the salt thereof (I) as an effective ingredient.

The present invention also relates to use of the biphenylmethane derivative or the salt thereof (1) as a pharmaceutical typified by a circulatory disease therapeutic such as a hypotensive agent.

Further, the present invention also relates to a therapeutic method of a circulatory disease, which comprises administering an effective amount of the biphenylmethane derivative or the salt thereof (I).

Best Modes for Carrying Out the Invention

In the present invention, the term "lower" as used for the description of each substituent in the formula (I) means a C₁₋₇, preferably C₁₋₅ group when the substituent represents a linear or a branched group, or a C₃₋₇ group when the substituent is a cyclic group.

Examples of the lower alkyl group represented by R¹ include methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl and n-pentyl.

Illustrative examples of the lower-cycloalkyl group represented by R¹ include cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl groups.

Exemplary substituted or unsubstituted phenyl groups represented by R¹ include - in addition to a phenyl group - phenyl groups mono-, di- or tri-substituted on their rings by a corresponding number of lower alkyl groups, halogen atoms, nitro groups, cyano groups and/or the like, such as tolyl, chlorophenyl, dichlorophenyl, trichlorophenyl, fluorophenyl, difluorophenyl, trifluorophenyl, nitrophenyl, dinitrophenyl and/or cyanophenyl groups.

Examples of the substituted or unsubstituted aralkyl groups represented by R¹ include - in addition to benzyl, phenethyl, benzhydryl and trityl groups - aralkyl groups mono-, di- or tri-substituted on their rings by a corresponding number of carboxyl groups, lower alkoxy carbonyl groups and/or the like, such as carboxybenzyl and/or methoxycarbonylbenzyl groups.

Examples of the substituted or unsubstituted acyl group represented by R¹ include alkanoyl, lower-cycloalkanoyl, lower alkenoyl, lower-cycloalkenoyl, lower alkoxy carbonyl, aralkyloxy carbonyl, carbamoyl, aromatic acyl and lower alkylsulfonoyl groups.

Illustrative alkanoyl groups represented by R¹ include - in addition to C₁₋₁₀ alkanoyl groups such as formyl, acetyl, propionyl, butyryl, valeryl, isovaleryl, pivaloyl, hexanoyl, heptanoyl, octanoyl and nonanoyl - halo-lower alkanoyl groups such as chloroacetyl, bromoacetyl, dichloroacetyl, trifluoroacetyl, chloropropionyl and tetrafluoropropionyl; hydroxy-lower alkanoyl groups such as hydroxyacetyl, dihydroxyacetyl, hydroxypropionyl and hydroxybutyryl; alkoxy-lower alkanoyl groups such as methoxyacetyl, ethoxyacetyl, methoxypropionyl and ethoxypropionyl; cyano-lower alkanoyl groups such as cyanoacetyl, cyanopropyl and cyanobutyryl; cycloalkyl-lower alkanoyl groups such as cyclopropylacetyl, cyclopropylpropionyl, cyclopentylpropionyl and cyclohexylpropionyl; aryl-lower alkanoyl groups such as phenylacetyl, phenylpropionyl and phenylbutyryl; aryloxy-lower alkanoyl groups such as phenoxyacetyl, chlorophenoxyacetyl and phenoxypropionyl; and heteroaryl-lower alkanoyl groups such as thiopheneacetyl, furanacetyl and pyridineacetyl.

Examples of the lower-cycloalkanoyl group represented by R¹ include - in addition to cyclopropylcarbonyl, cyclobutylcarbonyl, cyclopentylcarbonyl and cyclohexylcarbonyl groups - lower-cycloalkanoyl groups substituted by one or more carboxyl groups such as carboxycyclopentylcarbonyl and carboxycyclohexylcarbonyl [including those protected by a group which is easily cleaved *in vivo*, such as methoxycarbonyloxymethyl, t-butoxycarbonyloxyethyl, cyclohexylcarbonyloxymethyl or (5-methyl-2-oxo-1,3-dioxol-4-yl)methyl].

Illustrative lower alkenoyl groups represented by R¹ include - in addition to acryloyl, methacryloyl, crotonoyl and pentenoyl groups - alkenoyl groups substituted by one or more carboxyl groups such as carboxyacryloyl and carboxycrotonoyl [including carboxyl groups protected by a group which is easily cleaved *in vivo*, such as methoxycarbonyloxymethyl, t-butoxycarbonyloxyethyl, cyclohexylcarbonyloxymethyl or (5-methyl-2-oxo-1,3-dioxol-4-yl)methyl].

Exemplary lower-cycloalkenoyl groups include - in addition to cyclopentenylcarbonyl and cyclohexenylcarbonyl groups - lower-cycloalkenoyl groups substituted by one or more carboxyl groups such as carboxycyclopentenylcarbonyl and carboxycyclohexenylcarbonyl [including carboxyl groups protected by a group which is easily cleaved *in vivo*, such as methoxycarbonyloxymethyl, t-butoxycarbonyloxyethyl, cyclohexylcarbonyloxymethyl or (5-methyl-2-oxo-1,3-dioxol-4-yl)methyl].

Exemplary lower alkoxy carbonyl groups represented by R¹ include methoxycarbonyl, ethoxycarbonyl, propoxycarbonyl, n-butoxycarbonyl and t-butoxycarbonyl groups.

Examples of the aralkyloxy carbonyl group represented by R¹ include benzyloxy carbonyl and phenethyloxy carbonyl groups.

Illustrative examples of the carbamoyl group represented by R¹ include - in addition to a carbamoyl group - lower-alkyl carbamoyl groups such as methylcarbamoyl, dimethylcarbamoyl and diethylcarbamoyl and cyclic carbamoyl groups such as pyrrolidinecarbonyl, piperidinecarbonyl and morpholinecarbonyl.

Examples of the aromatic acyl group represented by R¹ include aroyl groups such as benzoyl and naphthoyl; aroyl groups - each of which has been mono-, di- or tri-substituted on its ring by a corresponding number of lower alkyl groups, halogen atoms, cyano groups, nitro groups, halo-lower alkyl groups, halo-lower alkoxy groups, carboxyl groups, carboxyl groups having a group which is easily cleaved *in vivo*, lower alkoxy carbonyl groups, alkoxy groups, hydroxyl groups, lower alkylthio groups, mercapto groups, amino groups, lower alkanoyl groups, tetrazolyl groups and/or the like - such as toluoyl, chlorobenzoyl, fluorobenzoyl, bromobenzoyl, iodobenzoyl, cyanobenzoyl, nitrobenzoyl, trifluoromethylbenzoyl, carboxybenzoyl [including carboxybenzoyl groups having a carboxyl group protected with a group which is easily cleaved *in vivo* such as methoxycarbonyloxymethyl, t-butoxycarbonyloxyethyl, cyclohexylcarbonyloxymethyl or (5-methyl-2-oxo-1,3-dioxol-4-yl)methyl], methoxycarbonylbenzoyl, dimethoxycarbonylbenzoyl, 2-carboxy-6-nitrobenzoyl, 2-ethoxycarbonyl-6-nitrobenzoyl, hydroxybenzoyl, methoxybenzoyl, trifluoromethoxybenzoyl, mercaptobenzoyl, methylthiobenzoyl, aminobenzoyl, acetylbenzoyl and tetrazolylbenzoyl; heteroyl groups such as thiophenecarbonyl (thenoyl), furancarbonyl (furoyl), pyridinecarbonyl, pyrazinecarbonyl, thiazolecarbonyl, benzothiophenecarbonyl and isoxazolecarbonyl; and heteroyl groups - each of which has been mono-, di- or tri-substituted on its ring by a corresponding number of lower alkyl groups, halogen atoms, cyano groups, nitro groups, halo-lower alkyl groups, carboxyl groups, alkoxy groups, hydroxyl groups, lower alkylthio groups, mercapto groups, amino groups, lower alkanoyl groups and/or the like - such as methylthiophenecarbonyl, chlorothiophenecarbonyl, cyanothiophenecarbonyl, nitrothiophenecarbonyl, trifluoromethylthiophenecarbonyl, carboxythiophenecarbonyl, methoxycarbonylthiophenecarbonyl, hydroxythiophenecarbonyl, methoxythiophenecarbonyl, mercaptothiophenecarbonyl, methylthiothiophenecarbonyl, aminothiophenecarbonyl, acetylthiophenecarbonyl, methylfurancarbonyl, chlorofurancarbonyl, cyanofurancarbonyl, nitrofurancarbonyl, trifluoromethylfurancarbonyl, carboxyfurancarbonyl, methoxycarbonylfurancarbonyl, hydroxyfurancarbonyl, methoxyfurancarbonyl, mercaptofurancarbonyl, methylthiofurancarbonyl, aminofurancarbonyl, acetylfurancarbonyl, methylpyridinecarbonyl, chloropyridinecarbonyl, cyanopyridinecarbonyl, nitropyridinecarbonyl, trifluoromethylpyridinecarbonyl, carboxypyridinecarbonyl, methoxycarbonylpyridinecarbonyl, hydroxypyridinecarbonyl, methoxypyridinecarbonyl, mercaptopyridinecarbonyl, methylthiopyridinecarbonyl, aminopyridinecarbonyl, acetylpyridinecarbonyl, carboxypyrazinecarbonyl, methylthiazolecarbonyl and methylisoxazolecarbonyl; benzenesulfonyl groups; and benzenesulfonyl groups - each of which has been mono-, di- or tri-substituted on its ring by a corresponding number of lower alkyl groups, halogen atoms, cyano groups, nitro groups and/or the like - such as toluenesulfonyl, fluorobenzenesulfonyl, trifluorobenzenesulfonyl, chlorobenzenesulfonyl, dichlorobenzenesulfonyl, bromobenzenesulfonyl and cyanobenzenesulfonyl.

Exemplary lower alkylsulfonyl groups represented by R¹ include methanesulfonyl and ethanesulfonyl.

Illustrative examples of the amino acid residue represented by R¹ include glycyl, leucyl, valyl, alanyl, phenylalanyl, alanyl-alanyl, glycyl-valyl and glycyl-glycyl-valyl, and also amino acid residues whose functional groups have been protected by a protective group commonly used in peptide chemistry, such as acyl or lower aralkyl.

Illustrative of the substituted or unsubstituted lower alkyl group represented by R² or R³ include lower alkyl groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl and n-pentyl; hydroxy-lower alkyl groups such as hydroxymethyl, hydroxyethyl and hydroxypropyl; halo-lower alkyl groups such as chloromethyl, chloroethyl, bromomethyl, dichloromethyl and trifluoromethyl; alkoxy-lower alkyl groups such as methoxymethyl, ethoxymethyl and dimethoxyethyl; carboxy-lower alkyl groups such as carboxyethyl and carboxyethyl; and alkoxy carbonyl groups such as ethoxycarbonylmethyl and methoxycarbonylmethyl.

When R² and R³ form a phenyl ring together with the adjacent carbon atoms, the ring may have thereon one or more substituents such as lower alkyl groups, lower alkoxy groups and/or halogen atoms.

Examples of the halogen atom represented by R² or R³ include fluorine, chlorine, bromine and iodine, with fluorine and chlorine atoms being preferred.

The term "the protective group" for the protected carboxyl group represented by R² or R³ means a desired group capable of undergoing relatively easy cleavage and yielding a corresponding free carboxyl group. Specific examples includes those removable upon treatment under mild conditions, such as hydrolysis or catalytic reduction, such as lower alkyl groups (e.g., methyl, ethyl, n-propyl, t-butyl, etc.), aralkyl groups (e.g., benzyl, etc.), and aryl groups (e.g., phenyl, etc.); and those readily cleaved *in vivo*, such as lower alkanoyloxy-lower alkyl groups (e.g., acetoxymethyl, pivaloyloxymethyl, etc.), lower alkoxy carbonyloxy-lower alkyl groups (e.g., methoxycarbonyloxymethyl, 1-ethoxycarbonyloxyethyl, etc.), lower-cycloalkylcarbonyloxy-lower alkyl groups (e.g., cyclohexylcarbonyloxymethyl, cyclopentylcarbonylox-

ymethyl, etc.), lower alkoxymethyl groups (e.g., methoxymethyl, etc.), lactonyl groups (phthalidyl, etc.), di-(lower alkyl)amino-lower alkyl groups (e.g., 1-dimethylaminoethyl, etc.), (5-methyl-2-oxol-4-yl)methyl group, and the like.

Illustrative examples of the lower-cycloalkyl group represented by R^2 or R^3 include cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl.

Illustrative examples of the lower alkenyl group represented by R^2 or R^3 include vinyl, allyl and isopropenyl.

Exemplary lower alkoxy groups represented by R^2 or R^3 include methoxyl, ethoxyl, propoxyl, n-butoxyl and t-butoxyl.

Examples of the lower alkylthio group represented by R^2 or R^3 include methylthio, ethylthio and n-propylthio.

Illustrative examples of the aryl group represented by R^2 or R^3 include phenyl, tolyl, xylyl, mesityl and naphthyl.

Examples of the protective group usable for the protected carboxyl group represented by B include the same protective groups as those exemplified above for the protected carboxyl group represented by R^2 or R^3 .

Exemplary protective groups usable for the protected tetrazol-5-yl group represented by B include triphenylmethyl, 2-tetrahydropyranyl, methoxymethyl and ethoxymethyl.

Preferred examples of the group represented by A include groups having a thiazoline, thiazole, oxazoline, oxazole, benzothiazoline, benzothiazole, benzoxazoline, benzoxazole, 1,3,4-thiadiazoline, 1,3,4-thiadiazole, 1,3,4-oxadiazoline, 1,3,4-oxadiazole, 1,2,4-thiadiazoline, 1,2,4-thiadiazole, 1,2,4-oxadiazoline, 1,2,4-oxadiazole, isoxazoline or isoxazole ring.

Preferred examples of such A include the groups represented by the following formulas (A-1)-(A-18):

wherein R^1 and R^2 have the same meanings as defined above and R^4 and R^5 each represents a substituent.

Among the above-exemplified groups A, particularly preferred are 2-iminothiazolyl (A-1), 2-iminooxazolyl (A-3), 2-iminobenzothiazolyl (A-5), 2-iminobenzoxazolyl (A-7), 2-imino-1,3,4-thiadiazolyl (A-9), 2-imino-1,3,4-oxadiazolyl (A-11), 5-imino-1,2,4-thiadiazolyl (A-13), 5-imino-1,2,4-oxadiazolyl (A-15) and

3-imino-isoxazoliny (A-17).

Preferred specific examples of the group represented by A include 2-acetylimino-5-ethylthiazolin-3-yl, 2-acetylimino-5-cyclopropylthiazolin-3-yl, 2-propionylimino-5-ethylthiazolin-3-yl, The compounds (I) of the present invention can be converted into both pharmacologically acceptable acid addition salts and base addition salts. Exemplary acid addition salts include (a) salts with mineral acids such as hydrochloric acid and sulfuric acid, (b) salts with organic carboxylic acids such as formic acid, citric acid, trichloroacetic acid, trifluoroacetic acid, fumaric acid and maleic acid, and (c) salts with sulfonic acids such as methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, mesitylenesulfonic acid and naphthalenesulfonic acid. On the other hand, illustrative base addition salts include (a) salts with alkali metals such as sodium and potassium, (b) salts with alkaline earth metals such as calcium and magnesium, (c) ammonium salts, (d) salts with nitrogen-containing organic bases such as trimethylamine, triethylamine, tributylamine, pyridine, N,N-dimethylaniline, N-methylpiperidine, N-methylmorpholine, diethylamine, cyclohexylamine, procaine, dibenzylamine, N-benzyl- β -phenethylamine, 1-phenamine and N,N'-dibenzylethylenediamine.

The compounds (I) of the present invention may be not only in unsolvated forms but also in hydrated or solvated forms. The compounds according to the present invention therefore embrace those in any crystalline forms and their hydrated and solvated products.

Further, the compounds (I) of the present invention include those containing an asymmetric carbon atom so that they can exist as optically active substances. These optically active substances are also embraced in the compounds of the present invention. The compounds (I) of the present invention also include those containing two or more asymmetric carbon atoms. They can exist as different stereoisomers (cis-form, trans-form). These stereoisomers are also included in the compounds of the present invention.

Each compound of the present invention represented by the formula (I) can be prepared by various processes. Preferred are Preparation Processes 1 and 2 shown by the following reaction schemes:

wherein R^1 , B, X, Y, Z and --- have the same meanings as defined above and L represents a halogen atom or a sulfonyloxy group.

Namely, a diazole derivative represented by the formula (2) and a biphenylmethyl halide derivative represented by the formula (3) are condensed together in the presence of a base, whereby a compound (1a) and/or a compound (1b) can be prepared.

Examples of the base usable in the above reaction include sodium hydride, lithium hydride, potassium carbonate, sodium carbonate, sodium alcoholates, t-butoxy-potassium, sodium hydroxide, potassium hydroxide, triethylamine and diisopropylethylamine. Any solvent can be used here as long as it does not affect the reaction. Exemplary usable solvents include aprotic polar solvents such as N,N-dimethylformamide and dimethylsulfoxide; ethers such as diethyl ether, tetrahydrofuran, dioxane, monoglymes and diglymes; halogenated hydrocarbons such as methylene chloride, chloroform and carbon tetrachloride; and alcohols such as methanol, ethanol and propanol.

As a reaction accelerator, a phase transfer catalyst can be added. Examples of the phase transfer catalyst include quaternary ammonium salts such as tetramethylammonium chloride, tetraoctylammonium chloride and tetrabutylammonium bromide; pyridinium salts such as N-neopentyl-4-(N',N'-dimethylamino)pyridinium chloride and N-(2-ethyl-hexyl)-4-(N',N'-dimethylamino)pyridinium chloride; and quaternary phosphonium salts such as tetrabutylphosphonium bromide and tetraphenylphosphonium bromide.

The reaction may ordinarily be conducted at -30°C to 150°C , preferably 10°C to 100°C . The reaction time may generally be 10 minutes to 24 hours, preferably 1 hour to 10 hours.

A particularly preferred example of the reaction is the one in which the metal salt of an azole derivative (2) is prepared in an aprotic polar solvent such as N,N-dimethylformamide by using sodium hydride as a base and then the resulting metal salt is reacted with a biphenylmethyl halide derivative (3) at a temperature of from 0°C to room temperature.

Examples of the halogen atom represented by L in the compound (3) include fluorine, chlorine, bromine and iodine. Illustrative of the sulfonyloxy group include alkylsulfonyloxy groups such as methanesulfonyloxy, ethanesulfonyloxy and trifluoromethanesulfonyloxy, and arylsulfonyloxy groups such as benzenesulfonyloxy and p-toluenesulfonyloxy.

Preparation Process 2

In the condensation shown in Preparation Process 1, the ratio of (1a) to (1b) so formed differs depending on the kind of R^1 in the azole derivative (2). By employing as R^1 a protective group which not

only has reaction selectivity but also is readily cleaved, as needed, either the compound (1a) or the compound (1b) can be obtained selectively. The iminoazoline derivative (1c) or aminoazole derivative (1d) is then available by the deprotection of the compound (1a) or (1b), respectively. Further, the compound (1a') or (1b') in which R¹ is other than a hydrogen atom can be obtained by alkylation or acylation of the compound (1c) or (1d) with a desired alkylating agent or acylating agent as needed.

Any known reaction can be employed for the deprotection. For example, the deprotection can be conducted by reacting the compound (1b) at a temperature of from room temperature to 100 °C in an aqueous alkaline solution such as an aqueous sodium hydroxide solution, aqueous potassium hydroxide solution or aqueous sodium carbonate solution or in an acidic solution such as hydrochloric acid or acetic acid while using a solution miscible with water, such as ethanol, methanol, tetrahydrofuran or N,N-dimethylformamide, or in a solventless manner.

The alkylation can be conducted by reacting an iminoazoline derivative or aminoazole derivative with an alkylating agent, which corresponds to a desired alkyl group and can be a dialkylsulfuric acid, alkyl iodide or alkyl bromide, at a temperature of from room temperature to 150 °C or so in a solution such as N,N-dimethylformamide or N-methylpyrrolidone in the presence of a base, preferably sodium carbonate or potassium carbonate.

The acylation, on the other hand, can be conducted by any desired reaction employed generally for the acylation of amino groups. Described specifically, the acylation can be conducted by reacting an iminoazoline derivative or aminoazole derivative with an acyl chloride or an acid anhydride, which corresponds to a desired acyl group, in an aprotic polar solvent - such as a halogenated hydrocarbon, e.g., methylene chloride, chloroform, carbon tetrachloride or chlorobenzene; an aromatic hydrocarbon, e.g., benzene or toluene; an ether, e.g., tetrahydrofuran or dioxane; acetonitrile; or N,N-dimethylformamide - at 0 °C to room temperature in the presence or absence of a base such as pyridine, picoline, N,N-dimethylaniline, N-methylmorpholine, dimethylamine, triethylamine, sodium carbonate or potassium carbonate; or by reacting the iminoazoline derivative or aminoazole derivative with an acid such as formic acid or acetic acid or an acid anhydride thereof at a temperature of from room temperature to 150 °C.

In Preparation Process 1 and Preparation Process 2, when the carboxyl group or tetrazol-5-yl group represented by B has a protective group, the protective group can be removed as needed.

When B represents a protected tetrazol-5-yl group, it is desired to conduct the protection by reacting the compound in a water-containing alcohol, or an ether, such as dioxane or tetrahydrofuran, which contains hydrochloric acid, acetic acid or the like, at room temperature or so for approximately 1-10 hours. When B represents a protected carboxyl group, on the other hand, any desired known reaction can be employed. For example, the deprotection can be conducted by reacting the compound at a temperature of from room temperature to 100 °C in an aqueous alkaline solution such as an aqueous sodium hydroxide solution, aqueous potassium hydroxide solution or aqueous sodium carbonate solution or in an acidic solution such as hydrochloric acid or acetic acid.

When B represents a cyano group, it can be converted into a tetrazol-5-yl group by a known method (Japanese Patent Laid-Open No. SHO 23868/1988).

The biphenyl derivative (3) can be prepared in a manner known to date (Japanese Patent Laid-Open No. 23868/1988, 27362/1991 or 74369/1991; J. Org. Chem., **56**, 2395-2400(1991); or the like).

Action

(1) Inhibitory action against the binding with angiotensin II (All) receptor, using cultured rat aortic smooth muscle cells

The present test was conducted in accordance with the method reported by Chiu et al. in European Journal of Pharmacology, **157**, 13-21(1988), though after some modifications.

Vascular smooth muscle cells, which had been separated from the aorta of a male Wistar rat and cultured on a 24-well multiplate were washed with a buffer of pH 7.4 containing 0.25% bovine serum albumin, 100 mM NaCl and 50 mM Tris, followed by the further addition of 0.1 ml of the buffer to each well. To each well, ¹²⁵I-All (final concentration: 2 x 10⁻¹⁰ M) was added together with or without a test compound to give a total volume of 0.2 ml. Then the wells were incubated for one hour at room temperature to make the ¹²⁵I-All and the test compound competitively bind to the vascular smooth muscle cells. Each well was thereafter washed with an ice-cold buffer three times to remove unbound ¹²⁵I-All. To the cells, 0.2 ml of a 1 mol/l solution of sodium hydroxide was added to solubilize the bound ¹²⁵I-All. A bound amount of ¹²⁵I-All contained in the resulting cell solution was measured by a gamma counter.

The above test was conducted for each compound at different concentrations of 3 doses or more. The inhibition rate against the specific binding with ^{125}I -All at each concentration was calculated in accordance with an equation to be set out subsequently herein. From the inhibition rate so calculated, the concentration (IC_{50}) of the test compound required for 50% substitution of the ^{125}I -All specific binding was calculated from linear regression line.

As a result of the test, compounds according to the present invention showed IC_{50} values presented in Table 1, respectively.

$$\text{Inhibition rate (\%)} = \frac{\frac{(\text{Specifically bound amount in the absence of a compound}) - (\text{specifically bound amount in the presence of the compound})}{(\text{Specifically bound amount in the absence of the compound})} \times 100$$

(2) Inhibitory activity to angiotensin II contraction in longitudinal ileac muscles excised from a guinea pig

A Hartley male guinea pig (350-450 g in weight) was sacrificed under exsanguination, followed by the excision of its ileum.

A longitudinal muscle tissue (2 cm long) was prepared from the ileum in a manner known *per se* in the art. The sample was suspended in a 20-ml Magnus cylinder filled with a Tylole solution [composition (mM): NaCl 137, KCl 2.7, CaCl_2 1.88, MgCl_2 1.1, NaH_2PO_4 0.4, NaH_2CO_3 11.8 and glucose 5.6]. The Tylole solution was incubated at 37°C and saturated with a mixed gas consisting of 95% O_2 + 5% CO_2 . Using an isometric transducer ("TB-611T", manufactured by Nihon Kohden Corporation), variations in contraction were measured. The measurement results were recorded on a computer ("PC-9801", manufactured by NEC Corporation).

Under a load of 0.5 g initial tension, the longitudinal muscle sample was equilibrated in a nutrient solution for about one hour while being washed therewith at intervals of 15 minutes. Then, contracture by the administration of 80 mM of KCl was repeated twice. After conforming that the contraction occurred stably, the following test was conducted.

First, 10^{-8}M angiotensin II was administered to the sample and its maximum contraction was recorded. The test compound was then administered to the sample and they were reacted for 20 minutes. Administered again was 10^{-8}M angiotensin II and the maximum contraction was measured. The maximum

angiotensin II contractions before and after the administration of the test compound were compared, whereby a contraction inhibition rate (%) was determined in accordance with the below-described equation. This test was repeated at increased concentrations of the test compound. A 50% contraction inhibition concentration (IC₅₀) was determined in accordance with a linear regressive calculation of the contraction inhibition rates.

As a result, compounds according to the present invention showed IC₅₀ values presented in Table 2.

$$\text{Contraction Inhibition rate (\%)} = \frac{\text{(Maximum contraction before administration of a compound)} - \text{Maximum contraction after administration of the compound}}{\text{Maximum contraction before administration of the compound}} \times 100$$

(3) Antihypertensive action on renal hypertensive rats (non-invasive)

Renal hypertensive rats were each prepared by constricting the left renal artery of a male SD rat (age: 6 weeks old, body weight: 200-220 g) with a silver clip (inner diameter: 0.017 inch) under anesthesia. The rats whose systolic blood pressure arose to 160 mmHg or higher in 4-8 weeks after the constriction of the renal artery were used for the test. The rats were maintained on food and water *ad libitum* until immediately before the test was started. Each test compound which was suspended in 0.5% methyl cellulose was orally administered at 10 mg/kg. After the administration of the test compound, the systolic blood pressure was measured periodically by a non-invasive sphygmomanometer ("BP-98", manufactured by SOFTLON K.K.). In accordance with the following equation, a decreased rate of blood pressure (%) was calculated from the

blood pressure values before and after the administration of the compound.

$$\text{Decreased rate of blood pressure (\%)} = \frac{(\text{Blood pressure before administration of the compound}) - (\text{Blood pressure after administration of the compound})}{\text{Blood pressure before administration of the compound}} \times 100$$

(4) Antihypertensive action on renal hypertensive rats (invasive)

Renal hypertensive rats were each prepared by constricting the left renal artery of a male SD rat (age: 6 weeks old, body weight: 190-220 g) with a silver clip (inner diameter: 0.017 inch) under anesthesia. Antihypertensive action was studied employing the rats whose mean blood pressure arose to 150 mmHg or higher in 4-8 weeks after the constriction of the renal artery. On the day before the test, a cannula for measure of blood pressure was inserted into the femoral artery of each of the renal hypertensive rats under anesthesia and was allowed to remain in the artery. The rats were maintained on food and water *ad libitum* until immediately before the test was started. The cannula so inserted was connected to a blood pressure transducer and mean blood pressure was recorded on a polygraph. After the blood pressure became stable, the test compound which was suspended in 0.5% carboxymethyl cellulose was orally administered to each of the rats at 3 mg/kg. In accordance with the following equation, a decreased rate of blood pressure (%) was calculated from the blood pressure values before and after the administration of the test compound.

$$\text{Decreased rate of blood pressure (\%)} = \frac{(\text{Blood pressure before administration of the compound}) - (\text{Blood pressure after administration of the compound})}{\text{Blood pressure before administration of the compound}} \times 100$$

As described above, the compound (I) according to the present invention and its salt are both novel compounds. They both have a potent angiotensin II antagonist activity, inhibitory action to smooth muscle contraction and antihypertensive action so that they are effective for the treatment and prevention of hypertension.

When the compounds (I) and their salts according to the present invention are used as treating agents for circulatory diseases, they can be formulated into compositions together with a pharmaceutically-acceptable carrier for parenteral administration such as injection or rectal administration or for oral administration in the form of a solid or a liquid.

Compositions of this invention for use as injections can take the form of pharmaceutically-acceptable germ-free water, non-aqueous solutions, suspensions or emulsions. Exemplary suitable non-aqueous carriers, diluents, solvents and vehicles include propylene glycol, polyethylene glycol, vegetable oils such as olive oil, and injectable organic esters such as ethyl oleate. These preparations can contain one or more auxiliary agents, for example, antiseptics, wetting agents, emulsifiers and dispersants. These formulations can be sterilized, for example, by filtering them through a bacterial filter or by mixing, immediately before use, a sterilizing agent in the form of a germ-free solid composition soluble in sterilized water or one of some other media which can be sterilized and injected.

Exemplary solid preparations for oral administration include capsules, tablets, pills, powders, granules, etc. Upon formulation of these solid preparations, the compounds according to the present invention are generally mixed with at least one inert extender such as sucrose, lactose or starch. One or more materials other than inert extenders, for example, a lubricant such as magnesium stearate can also be incorporated in the preparations upon formulation of the latter in a usual manner. A buffer can also be incorporated in the case of capsules, tablets and pills. Tablets and pills can be applied with an enteric coating.

Illustrative liquid preparations for oral administration include pharmaceutically-acceptable emulsions, solutions, suspensions, syrups and elixirs, which contain an inert diluent employed commonly by those skilled in the art, for example, water. In addition to such an inert diluent, the liquid preparations can also be added with one or more auxiliary agents, for example, wetting agents, emulsifiers, suspending agents, sweetening agents, seasoning agents and perfumes. Preparations for rectal administration are preferred to contain an excipient such as cacao butter or suppository wax in addition to a compound according to the present invention.

The dosage of the compounds (I) according to the present invention depends on the properties of the compound to be administered, the administration route, the desired treatment term and other factors. It generally ranges from about 0.1 mg/kg to 100 mg/kg per day, with about 0.5-50 mg/kg per day being preferred especially. If desired, this daily dosage can be administered in 2-4 portions.

Examples

The present invention will now be explained in detail with reference to Examples and Reference Examples, but the present invention is not limited to these Examples.

Reference Example 1

2-Acetylamino-5-methyl-1,3,4-thiadiazole:

To a mixture of toluene (20ml) and triethylamine(2.63g) was added 2-amino-5- methyl-1,3,4-thiadiazole (3.0g) and acetic anhydride(3.2g). The mixture was heated under reflux for 2.5 hours. After cooling, the precipitated solid was filtrated, washed with water and dried. The title compound(3.65g) was obtained.

Reference Example 2

2-Butyrylamino-5-ethyl-1,3,4-thiadiazole:

5 2-Amino-5-ethyl-1,3,4-thiadiazole (0.5g) was added to a mixture of toluene (5ml) and triethylamine (0.4g). With stirring, butyryl chloride (0.5g) was added to the suspension at room temperature. After stirring for 2 hours, aqueous sodium bicarbonate solution and ethyl acetate were added to the reaction mixture. The organic layer was separated and washed with water several times. The precipitated crystals and the organic layer were combined and the solvent was concentrated to 5 ml. The precipitated crystals were filtrated and
 10 dried. The title compound (0.62g) was obtained.

Several azole derivatives shown formula (2) were synthesized in a similar manner as above.

Synthetic methods of thiadiazoline derivatives and thiadiazole derivatives (group A/A-9,A-10) by preferable Preparation Process 1 in the present invention were described as below (example 1~example 15).

15 Example 1

Using a sodium hydride as a base in Preparation Process-1, the compounds shown below were synthesized.

20 (1) 2-Butyrylimino-5-ethyl-3-[2'-(1H-tetrazol-5-yl) biphenyl-4-yl]methyl-1,3,4-thiadiazoline[Compound No.1]

To a suspension of sodium hydride (60mg, 55% in oil) in N,N-dimethylformamide (5ml) was added 2-ethyl-5-butyrylamino-1,3,4-thiadiazole (0.26g) at room temperature. When evolution of hydrogen ceased, a solution of 4'-bromomethyl-2-(N-triphenylmethyltetrazol-5-yl)biphenyl (0.7g) in N,N-dimethylformamide (5ml) was added to the reaction mixture. After stirring for 3 hours at room temperature, water
 25 and ethyl acetate were added to the mixture. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue containing two major products on thin-layer chromatography was separated by column chromatography on silica gel (eluent: chloroform).

The first eluted fractions were collected and the solvent was evaporated. To the residue were added
 30 dioxane (5ml) and 10% hydrochloric acid solution (1ml), and the mixture was stirred for 1 hour at room temperature. The reaction mixture was made basic with 5% aqueous sodium hydroxide solution. The aqueous layer was washed with ether, adjusted to about pH 2 with 10% hydrochloric acid solution, and extracted with ethyl acetate. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was
 35 evaporated. The resultant oil crystallized on standing. Diisopropyl ether was added, and the crystals were filtrated and dried. The title compound(No.1) was obtained as colorless crystals(100mg).

45 The residue containing two major products described in example 1(1) was separated by column chromatography on silica gel (eluent: chloroform).

The secondly eluted fractions were collected and the solvent was evaporated. To the residue were added dioxane (5ml) and 10% hydrochloric acid solution (1ml), and the mixture was stirred for 1 hour at room temperature. The reaction mixture was made basic with saturated aqueous hydrogen bicarbonate solution. The aqueous layer was washed with ether, adjusted to about pH 2 with 10% hydrochloric acid
 50 solution, and extracted with ethyl acetate. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The resultant oil crystallized on standing. Diisopropyl ether was added, and the crystals were filtrated and dried. The title compound(No.2) was obtained as colorless crystals(30mg).

Example 7

- 5 (1) 2-Acetylimino-5-ethyl-3-[2'-(1H-tetrazol-5-yl) biphenyl-4-yl]methyl-1,3,4-thiadiazoline[Compound No.104]:

To a suspension of sodium hydride(70mg 55% in oil) in N,N-dimethylformamide (5ml) was added 2-ethyl-5-acetylamino-1,3,4-thiadiazole (0.26g) at room temperature. When evolution of hydrogen ceased, a solution of 4'-bromomethyl-2-(N-triphenylmethyltetrazol-5-yl)biphenyl (0.8g) in N,N-dimethylformamide
10 (5ml) was added to the mixture. After stirring for 25 hours at room temperature, water and ethyl acetate were added to the mixture. The organic layer was separated, washed with water and then dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue containing two major products on thin-layer chromatography was separated by column chromatography on silica gel (eluent: chloroform) The first eluted fractions were collected and the solvent was evaporated. To the residue were added dioxane (5ml) and 10% hydrochloric acid
15 solution (1ml), and the mixture was stirred for 1 hour at room temperature. The reaction mixture was made basic with 5% aqueous sodium hydroxide solution. The aqueous layer was washed with ether, adjusted to about pH 2 with 10% hydrochloric acid solution, and extracted with ethyl acetate. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The title compound(No.104) was obtained as a colorless powder (80mg).

- (2) 2-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methylamino-5-ethyl-1,3,4-thiadiazole hydrochloric acid-[Compound No.105]:

The residue containing two major products described in example 7(1) was separated by column chromatography on silica gel (eluent: chloroform).

30 The secondly eluted fractions were collected and the solvent was evaporated. To the residue were added dioxane (5ml) and 10% hydrochloric acid solution (1ml), and the mixture was stirred for 1 hour at room temperature. The reaction mixture was made basic with 5% sodium hydroxide solution and the mixture was stirred for 30 minutes. The aqueous layer was washed with ether and adjusted to about pH 2 with 10% hydrochloric acid solution. The precipitated solid was filtrated, well washed with water and dried.

Reference Example 3

2-Imino-5-ethyl-3-[2'-(N-triphenylmethyltetrazol-5-yl) biphenyl-4-yl]methyl-1,3,4-thiadiazoline

To a suspension of sodium hydride (43mg, 55% in oil) in N,N-dimethylformamide (10ml) was added 2-ethyl-5-trifluoroacetyl-amino-1,3,4-thiadiazole (225mg) at room temperature. When evolution of hydrogen ceased, 4'-bromomethyl-2-(N-triphenylmethyltetrazol-5-yl)biphenyl (557mg) was added, and then the mixture was stirred at 70 °C on oil bath for 10 hours. After cooling, water and ethyl acetate were added. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was purified by column chromatography on silica gel (eluent: chloroform). The fractions containing main product were collected and the solvent was evaporated.

To the residue was added tetrahydrofuran (20ml) and 5% sodium hydroxide (2ml), and the mixture was stirred at 70 °C on oil bath for 6 hours. After cooling, the solvent was removed in vacuo. Water and chloroform were added to the residue. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was purified by column chromatography on silica gel (eluent: chloroform/methanol = 20/1) to give the title compound as a colorless powder(400mg).

N-[5-Ethyl-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methyl -1,3,4-thiadiazoline-2-yliden]phthalamic acid [Compound No.126]:

2-Imino-5-ethyl-3-[2'-(N-triphenylmethyltetrazol-5-yl) biphenyl-4-yl]methyl-1,3,4-thiadiazoline (60mg) and phthalic anhydride (15mg) were added to N,N-dimethylformamide (1ml), and the mixture was stirred for 20 hours at room temperature. Water and ethyl acetate were added to the mixture, the organic layer was separated, washed with water and evaporated. 5% Sodium hydroxide solution and ether were added to the residue. The aqueous layer was separated, neutralized with 20% hydrochloric acid solution, and extracted with chloroform. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated.

To the residue were added dioxane (3ml) and 20% hydrochloric acid solution (0.1ml), and the mixture was stirred for 20 hours at room temperature. The reaction mixture was made basic with 5% aqueous sodium hydroxide solution. The aqueous layer was washed with ether, neutralized with 10% hydrochloric acid, and extracted with chloroform. The organic layer was separated, washed with water and dried over

anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The title compound No.126 was obtained as a colorless powder(20mg).

Reference Example 4

cis-3,4,5,6-Tetrahydrophthalic acid monobenzyl ester (1.51g) and benzylalcohol (1ml) were added to tetrahydrofuran, and to the solution was added catalytic amount of 4-dimethylaminopyridine, then the mixture was refluxed for 6 hours. After cooling to room temperature, the solvent was evaporated in vacuo. The residue was partitioned between chloroform and aqueous 5% sodium hydroxide solution, then the aqueous layer was separated. With stirring, the aqueous layer was acidified with 20% hydrochloric acid solution on ice, and extracted with chloroform. The organic layer was dried over anhydrous magnesium sulfate and evaporated in vacuo. The title compound was obtained as a colorless oil (1.93g).

Example 18

2-[[5-Ethyl-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl] methyl-1,3,4-thiadiazoline-2-yliden]aminocarbonyl]-1-cyclohexenecarboxylic acid benzyl ester[Compound No.152]:

(±)-cis-3,4,5,6-Tetrahydrophthalic acid monobenzyl ester (78mg) was added to oxalyl chloride (1ml), and the mixture was stirred for 10 minutes (until evolution of gas ceased). The solvent was evaporated in vacuo

at room temperature and the residue was further dried under vacuo for 1 hour. The residue was dissolved in tetrahydrofuran (2ml), then to the solution were added 2-imino-5-ethyl-3-[2'-(N-triphenylmethyltetrazol-5-yl)-biphenyl-4-yl]methyl-1,3,4-thiadiazoline(120mg) and triethylamine (3drops), and the mixture was stirred at room temperature for 2 hours. To the mixture were added water and ethyl acetate followed by stirring. The organic layer was separated, dried over anhydrous magnesium sulfate, and evaporated in vacuo. The residue was purified by column chromatography on silica gel(eluent:chloroform/methanol = 10/1).

The resultant oily residue was dissolved in tetrahydrofuran (5ml), to the solution was added to 20% hydrochloric acid solution (10drops) followed by stirring for 20 hours at room temperature. The solvent was removed below 20 °C, then the resultant solvent was further removed by azeotropic distillation of toluene twice. The residue was purified by column chromatography on silica gel (eluent:chloroform/methanol = 10/1) to give the title compound No.152 as a colorless powder(38mg).

The prodrugs (example24~example27) of compound No.126 were synthesized as below.

Example 24

N-[5-Ethyl-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methyl -1,3, 4-thiadiazoline-2-yliden] phthalamic acid 5-methyl-2-oxo-1,3-dioxalane-4-methyl ester[Compound No.168]:

N-[5-Ethyl-3-[2'-(N-triphenylmethyltetrazol-5-yl) biphenyl-4-yl]methyl-1,3,4-thiadiazoline-2-yliden] phthalamic acid (75mg) and 4-bromomethyl-5-methyl-2-oxa-1,3-dioxalane (50mg) were added to N,N-dimethylformamide (2ml), then to the solution was added potassium carbonate (30mg). The mixture was stirred for 4 hours at 90 °C. After cooling, water and ethyl acetate were added to the mixture followed by stirring for 30 minutes. The organic layer was separated and the aqueous layer was extracted with ethyl acetate twice. The organic layer was combined, washed with water twice and dried over anhydrous magnesium sulfate. After removal of the solvent in vacuo, the residue was purified by column chromatography on silica gel (eluent:chloroform).

The resultant residue was dissolved in tetrahydrofuran (5ml), then to the solution was added 20% hydrochloric acid solution (5drops) followed by stirring for 20 hours at room temperature. The solvent was removed below 20 °C, then the resultant solvent was further removed by azeotropic distillation of toluene twice. The residue was purified by column chromatography on silica gel (eluent:chloroform) to give the title compound No.168 as a colorless powder(12mg).

- To a suspension of potassium carbonate (600mg) in N,N-dimethylformamide (30ml) were added 2-t-butylloxycarbonylamino-5-ethyl-1,3,4-thiazole (687mg) and 4'-bromomethyl-2-(N-triphenylmethyltetrazol-5-yl) biphenyl(1.67g), then the mixture was stirred at 60 °C on oil bath for 6 hours. After cooling, water and
55 ethyl acetate were added to the mixture. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was purified by column chromatography on silica gel (eluent: chloroform). The fractions containing pure title compound were collected and the solvent was removed. 4N Hydrochloric acid

in dioxane (30ml) was added to the residue, and the mixture was stirred for 20 hours at room temperature. After removal of the solvent, the precipitate was washed with ether by decantation twice. The glassy precipitate was dispersed with ether and filtrated. The precipitate was dried to give the title compound- (560mg).

Synthetic methods (Preparation Process 2) of sulfonyliminothiadiazoline derivatives were described as below (example 32~33).

Example 32

2-(2-Chlorobenzenesulfonyl)imino-5-ethyl-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methyl-1,3,4-thiadiazoline- [Compound No.205]:

2-Imino-5-ethyl-3-[2'-(N-triphenylmethyltetrazol-5-yl)biphenyl-4-yl]methyl-1,3,4-thiadiazoline (60mg), 2-chlorobenzenesulfonylchloride (21mg) and triethylamine (11mg) were added to N,N-dimethylformamide (0.5m). After stirring for 20 hours, water and ethyl acetate were added to the mixture. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was separated by column chromatography on silica gel (eluent: chloroform) The fractions containing main product were collected and the solvent was evaporated.

To the residue were added tetrahydrofuran (3ml) and 20% hydrochloric acid solution (0.1ml) followed by stirring at room temperature. After stirring for 20 hours, the reaction mixture was made basic with 5% aqueous sodium hydroxide solution. The aqueous layer was washed with ether, neutralized with 20% hydrochloric acid solution, and extracted with the mixed solvent of chloroform and tetrahydrofuran. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was powdered from ether, and the powder was filtrated and dried. The title compound No.205 was obtained as a pale

yellow powder(12mg).

2-[N-(2-Cyanobenzenesulfonyl)-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl)methyl]amino-5-ethyl-1,3,4-thiadiazole
[Compound No.211]:

To a suspension of sodium hydride (4mg, 55% in oil) in N,N-dimethylformamide (0.5ml) was added 2-
[N-(2'-(N-Triphenylmethyltetrazol-5-yl)biphenyl-4-yl)methyl]amino-5-ethyl-1,3,4-thiadiazole (60mg) at room
temperature. When evolution of hydrogen ceased, 2-cyanobenzenesulfonyl chloride (20mg) was added to the
mixture. After stirring for 20 hours at room temperature, water and ethyl acetate were added to the mixture.
The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The
magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was separated by
column chromatography on silica gel (eluent: chloroform). The fractions containing main product were
collected and the solvent was evaporated.

Example 36

(1) 2-Cyclopropylcarbonylimino-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methylthiazoline-4-carboxylic acid
 ethyl ester[Compound No.217]:

To a suspension of sodium hydride (24mg, 55% in oil) in N,N-dimethylformamide (2ml) was slowly
 added 2-cyclopropylcarbonylaminothiazole-4-carboxylic acid ethyl ester (152mg). When evolution of
 hydrogen ceased, a solution of 4'-bromomethyl-2-(N-triphenylmethyltetrazol-5-yl)biphenyl (279mg) in
 N,N-dimethylformamide (3ml) was added. After stirring for 3 hours at room temperature, water and ethyl
 acetate were added to the mixture. The organic layer was separated, washed with water and dried over
 anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was
 evaporated. The residue was separated by column chromatography on silica gel (eluent: chloroform).
 The fractions containing trytlyated title compound were collected and the solvent was evaporated. Ethyl
 acetate was added to the residue and the precipitate was filtrated. The filtrate was evaporated.

To the residue were added dioxane (4ml) and hydrochloric acid solution (2ml). After stirring for 1 hour at
 room temperature, the reaction mixture was made basic with saturated sodium bicarbonate solution. The
 aqueous layer was washed with ether, neutralized with 10% hydrochloric acid solution, and extracted
 with ethyl acetate. The organic layer was separated, washed with water and dried over anhydrous
 magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated.
 Ether was added, and the precipitate was filtrated and dried. The title compound No.217 was obtained as
 a colorless powder(35mg).

(2) 2-[N-Cyclopropylcarbonyl-N-(2'-(1H-tetrazol-5-yl) biphenyl-4-yl)methyl]aminothiazole-4-carboxylic acid ethyl ester[Compound No.218]:

To a suspension of sodium hydride (24mg, 55% in oil) in N,N-dimethylformamide (2ml) was slowly added 2-cyclopropylcarbonylaminothiazole-4-carboxylic acid ethyl ester (152mg). When evolution of hydrogen ceased, a solution of 4'-bromomethyl-2-(N-triphenylmethyltetrazol-5-yl)biphenyl (279mg) in N,N-dimethylformamide (3ml) was added. After stirring for 3 hours at room temperature, water and ethyl acetate were added to the mixture. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was separated by column chromatography on silica gel (eluent: chloroform). The fractions containing trytlylated title compound were collected and the solvent was evaporated. Ethyl acetate was added to the residue and the crystals were filtrated.

The crystals were dissolved in the mixed solvent of dioxane (3ml) and chloroform (1ml), to the solution was added conc. hydrochloric acid solution (2ml) followed by stirring at room temperature. After stirring for 1 hour, the reaction mixture was made basic with saturated sodium bicarbonate solution. The aqueous layer was washed with ether, neutralized with 10% hydrochloric acid solution, and extracted with ethyl acetate. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. Diisopropyl ether was added, and the precipitate was filtrated and dried. The title compound No.218 was obtained as a colorless powder(32mg).

Synthetic methods of following two thiadiazole derivatives by preferable Preparation Process 1 in the present invention were described as below (example 40~ example 44).

[Synthesis of thiazoleacetic acid derivative]

Example 40

(1) 2-[N-Butyryl-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl)methyl]aminothiazole-4-acetic acid ethyl ester-[Compound No.260]:

To a suspension of sodium hydride (40mg, 55% in oil) in N,N-dimethylformamide (5ml) was added 2-butyrylaminothiazole-4-acetic acid ethyl ester (0.2g). When evolution of hydrogen ceased, a solution of 4'-bromomethyl-2-(N-triphenylmethyltetrazol-5-yl)biphenyl (0.4g) in N,N-dimethylformamide (5ml) was added. After stirring for 3 hours, water and ethyl acetate were added to the mixture. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration and the filtrate was evaporated. The residue was purified by column chromatography on silica gel(eluent: chloroform). The fractions containing main product were collected and the solvent was evaporated.

The residue was dissolved in dioxane (5ml), to the solution was added 10% hydrochloric acid solution (1ml) followed by stirring at room temperature. After stirring for 2 hours, the reaction mixture was made basic with 5% aqueous sodium hydroxide solution. The aqueous layer was washed with ether, adjusted to about pH 2-3 with 10% hydrochloric acid solution, and extracted with ethyl acetate. The organic layer was separated, washed with water and dried over anhydrous magnesium sulfate. The

magnesium sulfate was removed by filtration and the filtrate was evaporated. The resultant oil crystallized on standing. Diisopropyl ether was added, and the crystals were filtrated and dried. The title compound No.260 was obtained as colorless crystals(78mg).

[Alkylaminothiazole derivatives]

Example 41

2-[N-n-Propyl-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl) methyl]amino-5-n-propylthiazole-4-carboxylic acid [Compound No.261]:

n-Propylthiourea (270mg), 3-chloro-2-oxohexanoic acid ethyl ester (441mg), and pyridine (0.28ml) were added to ethanol (10ml), and the solution was refluxed for 3.5 hours. The solvent was evaporated. The residue was extracted with chloroform (20ml), and washed with dilute hydrochloric acid solution (10ml). The organic layer was dried over anhydrous magnesium sulfate and evaporated. The residue was purified by column chromatography on silica gel(eluent:chloroform/methanol = 100/1), 2-n-propylamino-5-n-propylthiazole-4-carboxylic acid ethyl ester (400mg) was obtained.

The 2-aminothiazole compound (400mg) obtained above and 1,3-dimethyl-3,4,5,6-tetrahydro-2-(1H)-pyridine (300mg) were added to tetrahydrofuran (3ml), then to the solution was added slowly 1.0M lithium hexamethyldisilazane (1.5ml) in tetrahydrofuran on ice. The solution was stirred for 20 minutes as such. To the solution was added of 2-(2-triphenylmethyltetrazol-5-yl)-4'-bromomethylbiphenyl (820mg) in tetrahydrofuran (2ml) on ice, and the mixture was stirred at room temperature for 3 hours. The solvent was evaporated. The residue was extracted with ethyl acetate (40ml). The organic layer was washed with dilute hydrochloric acid solution followed by washing with 20ml of saturated sodium chloride solution, dried over anhydrous magnesium sulfate, and then was evaporated. The residue was separated by column chromatography on silica gel(eluent : chloroform) to give yellow oily compound (510mg). The yellow oily compound was added to dioxane (20ml), to the solution was added conc. hydrochloric acid solution (18ml) at room temperature, then the solution was stirred for 1.5 hour. To the solution was added water (40ml), and the mixture was extracted with ethyl acetate (40ml). The organic layer was dried over anhydrous magnesium sulfate and evaporated. The residue was purified by column chromatography on silica gel(eluent : chloroform → ethyl acetate) to give the title compound No.261 as a pale yellow amorphous(149mg).

Example 43

2-[N-n-Propyl-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl)methyl] amino-5-n-propylthiazole-4-carboxylic acid-[Compound No.268]:

The compound No.261 (230mg) obtained in example 41 was added to ethanol (2ml) and 10% sodium hydroxide (1ml). After stirring for 4 hours at room temperature, the reaction mixture was acidified with 20% hydrochloric solution (1ml) and extracted with ethyl acetate (40ml). The organic layer was dried over anhydrous magnesium sulfate, and the solvent was evaporated. Hexane was added to the residue. The precipitated solid was filtrated and dried to give the the title compound No.268(90mg).

Property pale brown powder

¹H-NMR(δppm in DMSO-d₆)

7.54-7.71(4H,m), 7.23(2H,d), 7.07(2H,d), 4.66(2H,s), 3.31(2H,t), 2.97(2H,t), 1.47-1.57(4H,m), 0.81-0.93-(6H,m)

Example 44

Compounds Nos.269~272 were synthesized in a similar manner to example 43.

(1) 2-[N-n-Butyl-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl)methyl]amino-5-n-propylthiazole-4-carboxylic acid-[Compound No.269]:

Property pale brown powder

¹H-NMR(δppm in DMSO-d₆)

7.54-7.68(4H,m), 7.23(2H,d), 7.07(2H,d), 4.66(2H,s), 3.34(2H,t), 3.00(2H,t), 1.47-1.60(4H,m), 1.20-1.33-(2H,m), 0.85-0.93(6H,m)

(2) 2-[N-Cyclopropylmethyl-N-(2'-(1H-tetrazol-5-yl) biphenyl-4-yl)methyl]amino-5-n-propylthiazole-4-carboxylic acid[Compound No.270]:

Property pale orange amorphous

¹H-NMR(δppm in CDCl₃)

6.81-7.86(8H,m), 4.67(2H,s), 3.22(2H,d), 3.06(2H,t), 1.57-1.88(2H,m), 0.88-1.00(4H,m), 0.51(2H,d), 0.17(2H,d)

(3) 2-[N-Benzyl-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl) methyl]amino-5-ethylthiazole-4-carboxylic acid-[Compound No.271]:

Property pale yellow powder

¹H-NMR(δppm in DMSO-d₆)

7.06-7.72(13H,m), 4.65(4H,s), 3.00(2H,q), 1.14(3H,t)

(4) 2-[N-Benzyl-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl)methyl]amino-5-n-propylthiazole-4-carboxylic acid [Compound No.272]:

Property pale yellow amorphous

¹H-NMR(δppm in DMSO-d₆)

7.06-7.71(12H,m), 6.75-6.78(1H,m), 4.66(4H,s), 2.97(2H,t), 1.47-1.61(2H,m), 0.89(3H,t)

The synthetic methods (Preparation Process-1) of benzothiazoline and benzothiazole derivatives (groupA/A-5,A-6) were described as below.

Example 45

Compounds Nos.273~276 were synthesized in a similar manner to example 1 (1) and (2).

(1) 2-Cyclopropylcarbonylimino-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methylbenzothiazoline[Compound No.273]:

Property colorless powder

¹H-NMR(δppm in CDCl₃)

7.13-8.03(12H,m), 5.75(2H,s), 1.86-1.95(1H,m), 1.20-1.28, 0.94-0.98(each 2H,each m)

(2) 2-[N-Cyclopropylcarbonyl-N-(2'-(1H-tetrazol-5-yl) biphenyl-4-yl)methyl]aminobenzothiazole[Compound No.274]:

Property colorless powder

¹H-NMR(δppm in DMSO-d₆)

7.06-7.89(12H,m), 5.64(2H,s), 1.85-1.99(1H,m), 0.86-0.96(4H,m)

(3) 2-Cyclopropylcarbonylimino-5,6-dimethyl-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methylbenzothiazoline [Compound No.275]:

Property colorless powder

¹H-NMR(δppm in DMSO-d₆)

7.43-7.62(6H,m), 7.23(2H,d), 7.08(2H,d), 5.59(2H,s), 2.27(6H,s), 1.81(1H,m), 0.80-0.88(4H,m)

(4) 2-[N-Cyclopropylcarbonyl-N-(2'-(1H-tetrazol-5-yl) biphenyl-4-yl)methyl]amino-5,6-dimethylbenzothiazole [Compound No.276]:

Property colorless crystals

Melting point 234-235 °C

¹H-NMR(δppm in DMSO-d₆)

7.57-7.70(6H,m), 7.23(2H,d), 7.08(2H,d), 5.78(2H,s), 2.31(6H,s), 2.15(1H,m), 0.80-0.96(4H,m)

The synthetic methods (Preparation Process-1) of oxadiazole derivatives (groupA/A-12) were described as below.

Reference Example 8

2-Amino-5-ethyl-1,3,4-oxadiazole:

n-Propionylthiosemicarbazide (40.3g) and lead(II)oxide (180g) were added to propanol (600ml), then the mixture was heated under reflux over night. After cooling, the precipitate was removed by filtration. The filtrate was evaporated to give crystals. Recrystallization from ethanol gave the title compound (7g).

Reference Example 9

2-Vareloylamino-5-ethyl-1,3,4-oxadiazole:

2-Amino-5-ethyl-1,3,4-oxadiazole (1.0g) was added to a mixture of pyridine (1ml) and tetrahydrofuran (10ml). To the mixture was added varelyl chloride (1.2g) under cooling on dryice/methanol. After stirring for 1 hour, water and ethyl acetate were added to the mixture followed by stirring. The organic layer was separated, washed with water, and dried over anhydrous magnesium sulfate. The magnesium sulfate was removed by filtration. The resultant oil crystallized on standing. Diisopropyl ether was added, and the crystals were filtrated and dried to give the title compound (0.26g).

Example 46

Using 2-vareloylamino-5-ethyl-1,3,4-oxadiazole as a starting material in the reaction of example 1, the corresponding oxadiazole derivatives was only obtained.

2-[N-Vareloyl-N-(2'-(1H-tetrazol-5-yl)biphenyl-4-yl)methyl] amino-5-ethyl-1,3,4-oxadiazole[Compound No.277]:

Property colorless powder

¹H-NMR(δppm in CDCl₃)

7.88-8.08(1H,m), 7.05-7.75(7H,m), 5.04(2H,s), 2.80-2.90(2H,m), 2.55-2.72(2H,m), 1.48-1.72(2H,m), 1.20-1.40(5H,m), 0.90(3H,t)

Syntheses of isoxazoline derivatives (group A/A-17) by Preparation Process-1

Example 47

Compounds Nos.278 and 279 were derived from 3-cyclopropylcarbonylamino-5-methylisoxazole and 3-butyrylamino-5-methylisoxazole in a similar manner to example 3.

(1) 3-Cyclopropylcarbonylimino-5-methyl-2-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl]methylisoxazoline-[Compound No.278]:

Property colorless powder

¹H-NMR(δppm in CDCl₃)

8.04(1H,d), 7.02-7.79(8H,m), 5.05(2H,s), 2.41(3H,s), 1.79-1.83(1H,m), 1.07-1.13(2H,m), 0.84-0.88(2H,m)

(2) 3-Butyrylimino-5-methyl-2-[2'-(1H-tetrazol-5-yl) biphenyl-4-yl]methylisoxazoline[Compound No.279]:

Property colorless powder

¹H-NMR(δppm in CDCl₃)

7.89(1H,d), 7.02-7.48(8H,m), 4.92(2H,s), 2.37(2H,t), 2.29(3H,s), 1.62-1.70(2H,m), 0.89(3H,t)

Example 48

Compounds Nos.280 and 281 were synthesized in a similar manner to example 18 and 20.

(1) cis-3-[[5-Ethyl-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl] methyl-1,3,4-thiadiazoline-2-yliden] aminocarbonyl]-5-norbornene-2-carboxylic acid benzyl ester[Compound No.280]:

Property colorless powder

¹H-NMR(δppm in CDCl₃)

8.14(1H,dd), 7.15-7.65(12H,m), 6.23(2H,s), 5.38(2H,s), 4.88(2H,dd), 3.62-3.67(1H,m), 3.39-3.43(1H,m), 2.81(2H,q), 1.39-1.51(2H,m), 1.30(3H,t)

(2) cis-3-[[5-Ethyl-3-[2'-(1H-tetrazol-5-yl)biphenyl-4-yl] methyl-1,3,4-thiadiazoline-2-yliden] aminocarbonyl]-5-norbornene-2-carboxylic acid[Compound No.281]:

Property colorless powder

¹H-NMR(δppm in DMSO-d₆)

7.51-7.68(4H,m), 7.30(2H,d), 7.10(2H,d), 6.34(1H,m), 6.10(1H,m), 5.48(2H,s), 2.70-3.20(4H,m), 2.88-(2H,q), 1.15-1.57(2H,m), 1.24(3H,t)

Industrial applicability

The compounds (I) and their salts according to the present invention have a potent angiotensin II antagonist activity and are therefore useful as preventives and/or therapeutics for circulatory diseases such as hypertension, heart diseases and cerebral apoplexy.

Claims

1. A biphenylmethane derivative represented by the following formula (I):

wherein A represents a group

10 in which R¹ represents a hydrogen atom, a lower alkyl group, a lower-cycloalkyl group, a substituted or unsubstituted phenyl group, a substituted or unsubstituted aralkyl group, a substituted or unsubstituted acyl group or an amino acid residue; X represents an oxygen atom, a sulfur atom or a group =CH-, Y represents a nitrogen atom or a group =CR²-, Z represents an oxygen atom, a nitrogen atom or a group =CR³-, said Y and Z not being hetero atoms at the same time, R² and R³ each independently represents a hydrogen atom, a halogen atom, a substituted or unsubstituted lower alkyl group, a protected or unprotected carboxyl group, a lower-cycloalkyl group, a lower alkenyl group, a lower alkoxy group, a lower alkylthio group or an aryl group or R² and R³ may form a substituted or unsubstituted benzene ring together with the adjacent carbon atoms; B represents a cyano group, a protected or unprotected carboxyl group or a protected or unprotected tetrazol-5-yl group and — means a double bond or a single bond; or a salt thereof.

- 20
2. A therapeutic for a circulatory disease, comprising as an effective ingredient a biphenylmethane derivative or a salt thereof according to claim 1.
 3. An antihypertensive agent, comprising as an effective ingredient a biphenylmethane derivative or a salt thereof according to claim 1.
 4. Use of a biphenylmethane derivative or a salt thereof according to claim 1 as a pharmaceutical.
 5. Use of a biphenylmethane derivative or a salt thereof according to claim 1 as a therapeutic for a circulatory disease.
 6. Use of a biphenylmethane derivative or a salt thereof according to claim 1 as an antihypertensive agent.
 7. A therapeutic method of a circulatory disease, which comprises administering an effective amount of a biphenylmethane derivative or a salt thereof according to claim 1.
 8. A therapeutic method according to claim 1, wherein the circulatory disease is hypertension.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP93/01134

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 4 to 8
because they relate to subject matter not required to be searched by this Authority, namely:

Claims 4 to 8 pertain to methods for treatment of the human body by therapy.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
